Title: Kamsan - A Travel Guide for Tourists in Cambodia

Project Description

Kamsan is a travel-guide website designed to help tourists discover Cambodia's destinations, traditional food, activities, culture, and useful travel information. It was originally developed as a static six-page website for Web I.

For the Web II final project, we will continue developing Kamsan by adding JavaScript, public API integration, and interactive functionality. The purpose is to transform the existing website into a more dynamic and convenient travel-planning application.

The website will retain its six main pages: **Home, Destinations, Food, Things To Do, Travel Guide, and Contact/About.**

Planned Features and Functionality

1. Destination Weather

The Destinations page will let visitors check the weather in Phnom Penh, Siem Reap, Kampot, and Koh Rong. After choosing a place, they can see the temperature, humidity, wind speed, and current weather. We will use JavaScript and a free weather API to provide this information.

2. Tourist Reviews

Kamsan will include a Tourist Reviews section where visitors can:

- View existing reviews
- Submit a new review
- Edit a review
- Delete a review

The review form will collect information such as the visitor's name, destination, rating, and comment. JavaScript form validation will ensure that the required information is entered

correctly.
This feature will demonstrate the four required HTTP methods:

- **GET**: retrieve and display reviews
- **POST**: submit a new review
- **PUT**: update an existing review
- **DELETE**: remove a review

Because JSONPlaceholder is a demonstration API, its changes are not permanently stored on its server. The website will update the reviews dynamically in the browser after successful API requests.

3. Search and Filter

Visitors can search and filter destinations, food, and activities based on their interests. For example, searching for “temple” will show places such as Angkor Wat, Bayon Temple, and Ta Prohm. The results will appear immediately without reloading the page.

4. Favorite Destinations

Users can save destinations they are interested in to a personal favorites list. The list will remain saved in the same browser, so users can view their favorite places when they return to the website.

5. Trip Planner

Users can choose destinations and activities and add them to their personal Cambodia travel plan. They can view their selected items and remove or rearrange them whenever needed.

6. Travel Recommendation Quiz

If time permits, the Home page will contain a short quiz that recommends a destination based on the user’s interests, such as: History and temples, Beaches, Nature, Food and culture.
For example, a visitor interested in beaches may receive Koh Rong as a recommendation, while someone interested in history may receive Siem Reap.

APIs to Be Used

API	Purpose	Methods
Open-Meteo API	Retrieve current weather for Cambodian destinations	GET
JSONPlaceholder API	Demonstrate the Tourist Reviews CRUD operations	GET, POST, PUT, DELETE

The Open-Meteo API will provide meaningful travel information, while JSONPlaceholder will be used to demonstrate REST API requests. No API key is required for their basic use.

Technologies and Concepts

The project will use:

- HTML5 and semantic elements
- CSS3 and responsive design
- Vanilla JavaScript
- `fetch()`
- `async/await`
- GET, POST, PUT, and DELETE requests
- DOM manipulation
- Event listeners
- Form validation
- Arrays and objects
- ES6+ syntax
- `localStorage`

- Loading and error messages
